

Data Center Community Power Fight Sheet

Power questions, public records, and a constructive alternative before the vote.

START HERE

Find the next vote or approval. Get the project's power request and costs into the public record. Ask what must be built, who pays if the project falls short or leaves, and whether developer-funded home batteries can strengthen the local grid.

READ THIS INTO THE RECORD

We welcome jobs and investment, but this project should not be approved until the public sees a complete power plan.

The plan should show how much electricity the project wants, which new power plants, lines, and substations it will need, who will pay for each piece, and who pays if the project uses less power than promised or shuts down.

The utility should also study whether the developer can pay for home batteries, rooftop solar paired with storage, and programs that reward local families for using less power when the grid is strained.

If the study shows those tools will help, put the funding, eligible households, deadlines, performance checks, and penalties into a signed public agreement before the company receives faster electric service.

Power

publish how much the project wants and when

Costs

show who pays for plants, lines, backup, and failure

Local

study developer-funded home batteries

QUESTIONS BEFORE THE VOTE

Is this a real, financed project tied to a real site?

Is the company asking the utility to connect it faster than usual or give it a special electric deal?

Which new power plants, lines, substations, and other costs might otherwise fall on regular customers?

What new dependable power will the project build, buy, or pay for?

Will the utility study developer-funded home batteries, rooftop solar paired with storage, and programs that lower use when the grid is strained?

If the study shows those tools will help, how many homes will benefit, how much power will be freed up, and by what date?

How long must the company keep paying, what is the minimum payment, and what happens if it uses less power or leaves?

Where is the signed public agreement listing who pays, what gets built, the deadlines, the progress reports, and the penalties?

Welcome good investment. Build the power plants and major lines America needs. If a utility study shows that home batteries, rooftop solar paired with storage, and programs that lower use can help the local grid, make the developer pay so participating families pay nothing.
